ABSTRACT OF THE DISCLOSURE

A data control structure rewriting program to control a
computer to function as a data control structure rewriting
device for storing a plurality of data sets in a hierarchical
structure in a recording section, where each data set
includes a folder and image data, the device comprises a
reading section; a data control structure analyzing section
to analyze the data control structure of additional data set
read by the reading section and to compare the analyzed data
control structure of the additional data set with the data
control structure of a data set stored in a hierarchical
position; and a data control structure generating section to
rewrite the hierarchical structure, wherein when the
comparison result of the data control structure analyzing
section satisfies a predetermined condition, the data control
structure generating section adds the additional data set in
the recording section by linking the additional data at the
hierarchical position in the hierarchical structure.
